Patent Data Matching Process for Environmental Startups in India

Anirul Islam

1 Matching Process

The patent records retrieved from WIPO PATENTSCOPE were cross-checked with supplementary information from QuickCompany and available company patent publication lists to assess their association with the selected environmental startups.

The matching process considered the company name, founder names, inventor names, company address, and business description. In particular, one founder's name matched one of the inventors listed in a candidate patent record. The company name, address, and business description were also consistent across the sources examined. These combined indicators were used as supporting evidence for the proposed match.

Patent records were retrieved for four of the 20 selected startups. For the remaining 16 startups, no matching records were found in the WIPO searches performed, including searches using alternative names. This outcome does not necessarily imply that these startups have never filed or obtained patents.

The matching decisions were based on the available evidence, and similarity in names alone was not treated as conclusive proof of patent ownership.
